games Category:Single-player video games Acid sphingomyelinase catalyzes hydrolysis of sphingomyelin to ceramide and phosphocholine.

The product, ceramide, promotes apoptosis. We and others found that ceramide is elevated in the plasma membrane of apoptotic tumor cells.

We tested the following hypothesis: Elevated ceramide in the plasma membrane induces apoptosis by stimulating sphingomyelinases and/or by stimulating an apoptotic pathway in the plasma membrane. We have found that apoptosis, as measured by DNA fragmentation, was induced

in 3-4 days by depletion of sphingomyelin by inhibition of acid sphingomyelinase with the specific inhibitor, A12. Cells (various types of leukemia, Jurkat, HL-60, CEM) were treated with inhibitors to different stages of the apoptotic pathway, including inhibitors of

caspases, calpains, and the plasma membrane. The result was apoptosis. Cells were treated with a calpain inhibitor, calpeptin, after the cells had been depleted of sphingomyelin by A12. Apoptosis was also induced.

In contrast, calpeptin did not induce apoptosis in non-depleted cells. The cells were also treated with an inhibitor of caspases, ZVAD, which had no effect on apoptosis. This result is consistent with the hypothesis that acid sphingomyelinase acts upstream in a pathway that includes sphingomyelinases. We have also found that the protein kinase C (PKC) inhibitor, bisindolylmaleimide, inhibits apoptosis in sphingomyelin-depleted cells, consistent with the hypothesis that PKC is a mediator of sphingomyelinase-induced apoptosis. These findings demonstrate that sphing

BioShock 2: Minerva's Den (PC)
review: FPS fans, rejoice! BioShock

2: Minerva's Den is more of the
same as the original, and it's just as
great. The game is really a no-
brainer, especially if you're
