A section profile, or "Section Profile," is a user-defined design element with a predefined appearance, and enables you to modify the content of a design element with only a few clicks. The section profile can be used in several different ways: - To change the way that an existing text, tabular, icon, table, and grid element looks and behaves. - To change the appearance of a block, line, text box, template, or surface. - To create a new layout element, such as a dashed line or a ruled line. - To modify the way a particular section of a document displays information. The section profiles that are available are listed below. Text profile Text profiles are used to format the text in a document. Text profiles include the font type and color, style, font size, and font characteristics. The text profile can be applied to a paragraph or to a character. Icon profile Icon profiles are used to format the icons in a document. Icon profiles include the font type, font size, and color, as well as style and location. Create your own style assets for describing your work and share them with others. Combine style assets to build an outline to save you the time of repeatedly typing the same comments. You can also save style assets, send them, and even load them into other applications. Support for Chinese language processing. Use auto-complete as you type and auto-complete-as-you-move to see possible values. Use auto-complete-as-you-type to import value into your drawing. Save Time: Save time by giving your entire drawing area a single active layer, or by automatically sending comments to your active layer.

Automatically place names when doing a referencing operation, which means you can save time when you paste the object's name into your drawing. With the new "Set Drawing Text Color" command, you can specify a specific text color in any dialog box, regardless of which color the user has selected for the system text color. (video: 1:30 min.) When you're in a multi-page drawing, you can easily switch between pages by using the "Go to previous/next page" command or clicking on the page numbers. Support for AutoCAD/CADDraw Save paper with the new option to print from the paper design panel

when you are in an existing drawing. Do more with DXF and DWG files: Easily plot DXF/DWG files on a map, with the new plotting tools. Convert DWG files to DXF. When you plot DXF files, you can choose to include or exclude the drawing area from the graph or graph legend. Draw lines based on their width or based on length. Import reference points into your DXF/DWG drawings. Integrate CAD data with your design documents (text comments, AutoCAD markup, etc.): Import text comments from your design document into drawings. Import reference points and text comments from the drawings into the design document. Import objects into your design document based on their size, so you can easily use them as reference points, dimensions, or any other standard object. Import objects and reference points into drawings based on their location. When you import CAD data into your design documents, there are commands for related objects (like planes, circles, and lines), for text comments, and for drawings.
